01 · PROBLEM

The challenge

Private hosts managing properties on Airbnb and Booking.com have no unified view of their finances. Income arrives from multiple platforms, expenses are scattered across invoices and notes, and there is no single place to understand the real profitability of each property.

GreenHelios solves this — aggregating all financial activity, displaying it clearly, and helping hosts make better decisions about their portfolio.

02 · PROCESS

Design approach

Structured product design process — starting from user needs, working through information architecture and wireframes in Figma, then progressing to high-fidelity UI and full implementation in two different technical stacks.

03 · USER

Who is this for?

A private individual hosting 2-10 properties on short-term rental platforms. Not a financial professional — needs clarity, not complexity.

Kostas, 38

Property owner · 4 Airbnb listings · Athens

→ See total income vs expenses at a glance

→ Know which property is most profitable

→ Track maintenance costs per property

→ Understand occupancy rates over time

→ Export financial reports for tax purposes

Design principles

Clarity over complexity

Data at a glance

Trust through accuracy

Fast navigation

Status always visible

Financial semantics

04 · VISUAL LANGUAGE

Color system

A semantic color system built around trust and clarity. The primary teal drives all interactive elements — CTAs, active states, and data visualizations. Financial status is communicated instantly through color: green for income, red for expenses, amber for warnings. Neutral backgrounds keep the focus on the data.

06 · ARCHITECTURE

Built twice, on purpose

The same product was implemented in two distinct technical architectures — a deliberate decision to understand how architecture affects design flexibility, performance, and user experience.

VERSION 1

Spring Boot + Thymeleaf

Java 17

Spring Boot 3.3

Thymeleaf

Bootstrap 5

PostgreSQL

Spring Security

2FA

Docker

Railway

Server-side rendering with strong security foundations, role-based access, single-session enforcement, and full test coverage with JUnit 5.

VERSION 2

Next.js + React

React

Next.js

TypeScript

Tailwind CSS

Chart.js

DnD Kit

Zod

Component-based architecture enabling richer interactions, custom design system, and greater flexibility in implementing the Figma designs with precision.

GitHub Repository →

KEY INSIGHT

Building the same design in two architectures revealed how technical constraints directly shape UX decisions. Bootstrap limited layout flexibility; React enabled pixel-perfect implementation of the design system. This is the core competency of a Design Technologist.

07 · TAKEAWAYS

What this demonstrates

Financial UX expertise

Complex data dashboards with transactions, KPIs, and multi-property reporting — backed by 3 years of fintech design.

Technical depth

Understands how design decisions affect implementation — not just how things look, but how they work in production.

End-to-end ownership

From Figma wireframes to deployed product — complete ownership without handing off to another team.

Fintech domain knowledge

3 years designing for NBG, EDPS, Euronet, and Cardlink. Financial products are not new territory.
